Previous Residence of Family Units, 1980

A brief profile of the populaton of East Boston, Charlestown, and Back Bay/ Beacon Hill, as well as the City of Boston, is provided in the accompanying tables. Information is included about population characteristics, households, occupations, housing, rental payments, income, and energy conservation.

This report describes each known characteristic of neighborhoods in sequence, rather than focusing on a particular aspect with respect to its stability or change, similarity or differences. This approach gives information that can be used flexibly to suit the user's needs.

The source of this information is primarily the 1980 Boston Redevelopment Authority Household Survey conducted by the Center for Survey Research of the University of Massachusetts. This survey was designed to preview the 1980 U.S. Census and to include many Census items, as well as to provide information on many items not contained in the Census. The data were obtained from a scientific sample of households that was large enough to insure appropriate representation and acceptable levels of sampling error for each neighborhood. They offer the most up-to-date information available about Boston's population, housing, work force, and income. The survey data provide an excellent way of comparing Boston's neighborhoods with each other and with the City as a whole.

The data are presented in the form of percentages within neighborhoods. In order to determine the actual number of persons in a neighborhood or in a category within a neighborhood, the proportions should be related to the 1980 U.S. Census count of persons in that neighborhood. Table 1 provides these basic numbers for each neighborhood. It indicates the number of persons residing in the neighborhood, defined in terms of B.R.A. planning district boundaries in 1970 and in 1980, with the intercensal change.

Between 1970 and 1980 Boston lost some 78,000 persons, or 12 percent of its 1970 population. However, this overall loss masks the experience of the various neighborhoods within the Eighth Congressional District. East Boston and Charlestown had population losses of 17 and 13 percent, respectively. In

contrast, Back Bay/Beacon Hill and Allston/Brighton showed population gains during the decade. Allston/Brighton grew by two and a half percent while Back Bay/Beacon Hill showed strong growth with a nearly 10 percent increase. These neighborhoods differ with respect to numerous characteristics other than population size and change during the past decade.

### Population Characteristics

#### Age

The age distribution of the City of Boston has changed in the ten years between 1970 and 1980 as seen in Tables 2 and 3. The population is now much more concentrated in the age groups between 15 and 44 years old than was true a decade ago. There are proportionally fewer children and persons of older working age and elderly. This bulge in the middle of the age distribution is seen for the age distributions of Charlestown and Allston/Brighton, and is particularly pronounced in Back Bay/Beacon Hill. However, East Boston's age distribution has changed in a different way. Residents are more concentrated among elementary aged children and those at or near retirement age, the obverse of the "pig in the python" profile seen in the other three neighborhoods.

The median age of the City of Boston is currently 28 years of age, two years younger than it was in 1970. This indicates the large influx of young adults into the City, and the younger age profile of a growing minority population. The three neighborhoods tend to have an older average age than Boston as a whole.

Charlestown residents average 28 years of age also, indicating its popularity among young adults. East Boston and Back Bay/Beacon Hill average 31 and 33 years of age. East Boston is more heavily weighted toward an older population while Back Bay/Beacon Hill has a dearth of children of school age which pushes its average age upward.

## Household Size

The average number of persons per Boston household declined from 2.8 in 1970 to 2.5 in 1980 in line with national trends. These declines are the result of (1) the greater tendency of young adults and elderly adults to live alone and (2) the decline in fertility of the past fifteen years or so.

The average household size varies across neighborhoods. On the low end is Back Bay/Beacon Hill with 1.5 persons per household. Charlestown, East Boston and Allston/Brighton are average with 2.4, 2.5 and 2.3 persons per household, respectively.

For Boston as a whole, almost one-third of the households contain only one person; households containing either one or two persons represent almost two-thirds of all households. While East Boston tends to have a distribution of household sizes that closely resembles that for Boston as a whole, Charlestown's and Back Bay/Beacon Hill's household sizes are noticeably different. Forty-one percent of Charlestown residents live alone. For Back Bay/Beacon Hill the figure is a whopping 60 percent live alone while another 35 percent live in two-person households. Therefore, only 5 percent of Back Bay/Beacon Hill residents live in households of three or more persons.

## Marital Status

The marital status of Boston's adult population is considerably different from that of the United States where some 60 percent of the adults are married. However, it is not so different from other large cities. As seen in Table 5, 42 percent of Boston's residents are married compared to 50 percent in 1970. Thirty-nine percent have never married, 9 percent are widowed, 4 percent are separated, and 6 percent are divorced.

East Boston is one of the neighborhoods with a high percentage married (50%). Low percentage married and a high percentage never married characterizes Back Bay/Beacon Hill, as might be expected. The proportion of residents

widowed is high and approaches 15 percent in East Boston, Charlestown and several other neighborhoods. In East Boston, there is an unusually high percentage of divorced and separated persons (16%).

### Family Composition

The family units that form Boston's households are of two basic types, families (two or more related individuals, as described in Appendix A) and unrelated individuals who may live alone or together with unrelated individuals or with families as boarders. Unrelated individuals have grown as a proportion of Boston family units during the last decade while husband-wife families have declined.

Unrelated individuals, i.e., one-person families, form 48 percent of Boston's family units compared to 39 percent in 1970.

Back Bay/Beacon Hill, and Allston/Brighton, with 78 percent and 72 percent unrelated individuals, respectively, have the highest proportions of any neighborhood. The presence of students and young professionals is the primary component of this high proportion of unrelated individuals. East Boston and Charlestown are closer to the Boston average with 33 percent and 44 percent of their residents unrelated.

Households headed by a married couple total 34 percent of Boston family units in 1980 compared to 44 percent in 1970. Married couples only form 13 percent of Boston households family units; another 19 percent of family units are composed of married couples with children.

Table 6 shows that all focal neighborhoods except Allston/Brighton tend to have a higher proportion of husband/spouse only families than does all of Boston. While East Boston (38%) and Charlestown (30%) have a goodly proportion of households with children compared to all Boston (31%), only 4 percent of Back Bay/Beacon Hill and 15 percent of Allston/Brighton family units contain children. On average, 40 percent of these households with children are single parent families. Families with an unmarried head now form 19 percent of Boston's family units, up slightly from 17 percent in 1970.

## Racial Composition and Hispanic Origin

The proportion of Boston's population that is non-white, including Blacks, American Indians, Orientals and Cape Verdeans, has increased steadily during the past several decades to 25 percent.

However, the proportion of non-whites has not changed appreciably in three neighborhoods of interest, as seen in Table 7. East Boston, Charlestown and Back Bay/Beacon Hill have remained almost entirely white. The dramatic four fold increase in Allston/Brighton non-whites is due to an increase in Chinese. The number of Chinese in Allston/Brighton approximates the number in Central and South End (Chinatown). The doubling of the counted Spanish population in Boston in the past ten years is reflected in the fact that 2 to 4 percent of the residents of each of the neighborhoods reports themselves to be Hispanic (see Table 8).

## Ethnic Background, Religion, and Language

Boston residents identify themselves as having many different places of family origin, although the four focal neighborhoods are similar in their concentration of those with a Northeastern European heritage. Bostonians most frequently mentioned Ireland (27%), Italy (12%), and other Western European countries (28%) as their place of family origin. Irish descendants are the predominant ethnic group in Charlestown (48%), with some Canadians, Italians, and British. Italians predominate in East Boston (57%) with a sizeable proportion of Irish (17%). Back Bay/Beacon Hill and Allston/Brighton are more mixed than are East Boston or Charlestown. About a quarter of Back Bay/Beacon Hill adult residents claim other Western European ancestry, as reported in Table 9. An additional 30 percent of Back Bay residents are of Irish or British descent.

The place of birth data in Table 10 show very different patterns for Boston and the four neighborhoods of interest. For Boston, the percentage of residents born in Massachusetts has had a small decline from 64 percent in 1970 to 60 percent in 1980. Those born elsewhere in the United States or in Canada have also shrunk, from 24 to 21 percent, while the percentage of persons born elsewhere throughout the world has grown by 50 percent.

In contrast, 83 percent of Charlestown residents were born in Massachusetts, and another 13 percent in other U.S. and Canada leaving only 3 percent foreign-born. This reflects a noteworthy lack of immigrants from outside of the local area, as will be seen in more detail in the Mobility section. Similarly, East Boston is composed of a sizeable 78 percent Massachusetts-born and a small additional 7 percent born in the U.S. or Canada. A noteworthy chunk (15%) are foreign born, presumably mostly Italian and some Hispanic.

On the other hand, only 41 percent of Back Bay/Beacon Hill residents were born in Massachusetts, the lowest proportion for any City neighborhood. Fully, 44 percent were born in the rest of the U.S. and Canada. This reflects the attractive power of this neighborhood for students and for young adults. Some 16 percent were born in a variety of places (elsewhere in the world). Allston/Brighton has a similar place-of-birth profile.

The language spoken at home correlates with ethnic origin and country of birth. In the four neighborhoods, the only large group of non-English-speaking persons are the 12 percent of East Bostonians who speak Italian at home. In addition, 6 percent of Allston/Brighton residents speak Chinese. There are smaller numbers of Spanish-speaking in each of the neighborhoods.

The religious upbringing of neighborhood residents varies quite a bit. Ninety-three percent of East Boston residents were raised as Catholics. Four out of five Charlestown residents were raised Catholic with the remainder raised as Protestants. In Back Bay/Beacon Hill and Allston/Brighton, half were raised as Catholics, one-quarter as Protestants, and one out of seven as a Jew, and a small proportion Other and Unspecified. Clearly, there is much more diversity in reported religious upbringing in the last areas.

### Educational Attainment

High school graduate is the modal educational attainment category for the City (34% of adults) with a combined total of 41 percent additional having had some education beyond high school, meaning college and/or graduate school.

There is great diversity in the educational attainment reported for Boston's neighborhoods. In East Boston and Charlestown, the modal education is again completion of high school. However, 40 percent of Charlestown residents have gone on to college while only 24 percent of East Boston residents have done so. In addition, over 20 percent of East Bostonians have no more than a grammar school education. This is undoubtedly related to the older, foreign-born population in this neighborhood.

The picture changes entirely for Back Bay/Beacon Hill. Two-thirds of the residents are college graduates and the additional third are high school graduates, some with college training. Clearly, this is a uniquely well-educated population when 90 percent have had some college experience. Allston/Brighton lies midway between the extremes. Eighty-seven percent are high school graduates and 42 percent have graduated from college.

### Employment Characteristics

#### Labor Force Participation and Employment

In the Spring of 1980, 62 percent of Boston's potential workers were working or seeking work, as shown in Table 14. This is an increase from the 59 percent labor force participation rate of 1970. Boston's high rate is partially the result of the national phenomenon of an increasing number of persons aged 16 years and older who are of working, not retirement age. Other factors are unique to Boston. For instance, about half of all family units in Boston are unrelated individuals rather than families, and 80 percent of these individuals are of working age, 16 to 65 years old. Related to these factors and most importantly, almost all the increase in participation rates is due to increased women's participation. Additionally, low unemployment rate of 5.7 percent helped maintain the high employment/population ratio of 59 percent seen in Table 15.

There was great variation between the Boston neighborhoods in the 8th District in terms of labor force participation and employment. Back Bay/Beacon Hill topped all Boston neighborhoods with a participation rate of 82 percent and employment ratio of 79 percent. East Boston had the lowest participation rate

in the City, 48 percent. Charlestown and Allston/Brighton fall in the middle. No doubt participation rates were related to the age structure and education levels cited earlier. Their effect on household income will be seen later.

### Occupations

There are other significant differences among neighborhoods with respect to the types of occupations held by employed persons. Seventy-five percent of Boston's employed workers are in professional, technical and managerial occupations (30%); clerical jobs (26%); and service occupations (19%), reported in Table 16. Growth in these occupational groupings during the last decade (See Table 17) can be tied to the transformation of Boston's economy from a manufacturing to a services base and the surge in this services-oriented economy. The percentage of workers from various neighborhoods engaged in occupations within these groupings gives a rough indication of the extent to which their workers are part of this change and growth. Fully, 91 percent of Back Bay/Beacon Hill workers, 86 percent of those living in Allston/Brighton, and 79 percent of workers from Charlestown are engaged in these types of occupations. Only 53 percent of East Boston residents hold these types of jobs.

The contrasts among the neighborhoods are more evident when the more detailed occupational groupings of Table 16 are compared. Back Bay/Beacon Hill has the highest percentage of its workforce in professional, technical, and managerial occupations of any City neighborhood, 71 percent. A small but significant proportion of its working residents are in clerical positions also. Allston/Brighton has 44 percent of its workers in professional, technical and managerial occupations. Twenty-six percent are in clerical and 16 percent in service occupations. Charlestown shows a similar pattern of 30 percent professional, 35 percent clerical and 14 percent in service. In East Boston, a different pattern emerges. Clerical workers (32%) are the predominant occupation with professionals and operatives next in importance (18%), followed by similar proportions of service workers and craftsmen, 13 and 12 percent, respectively.

All of these neighborhoods, nevertheless, have had a dramatic increase in the proportion of professional, etc., workers during the 1970's, all in excess of the 30 percent increase citywide. East Boston has also had a significant increase in clerical workers and generally upgraded its occupational mix.

### Industry of Employment

The industrial mix of workers' jobs also varies considerably by neighborhood. Table 18 shows that the largest employer in East Boston and Charlestown is government, which employs one-third of the workers. For Back Bay/Beacon Hill and Allston/Brighton, about 40 percent of the workers are employed in high grade, export service industries. Education and medicine would fall in this category. By and large, these two industrial groupings, government and export services, change places and are the second most important employing industries in these two pairs of neighborhoods. Manufacturing employs a significant chunk of East Boston workers (19%), as does retail sales for Allston/Brighton (14%).

Table 19 provides a comparison of the industry of employed Bostonians with the industrial distribution of jobs within Boston. It shows that one-third of Boston's jobs are in the services, and half that proportion are in government. These two major employers account for about half of Boston's jobs. The distribution of all Boston workers indicates that the Boston workers' profile is more heavily weighted toward manufacturing and government than is the City job profile by industry. This comparison indicates that the workers in a neighborhood like Back Bay/Beacon Hill or Allston/Brighton, which has a similar job mix to that of the City, is likely to be participating more fully in the economic life of the City.

### Location and Means of Getting to Work

Interestingly, Table 20 does not show that neighborhoods with job mixes unlike Boston must disproportionately seek employment outside Boston. Instead, proximity to the downtown nexus of jobs and geographical location generally are the more important determinants of whether or not neighborhood workers are employed within or outside the City. A similar pattern is seen

for means of getting to work in Table 21. The closer a worker is to downtown, the more likely he/she is to walk to work. Surrounding neighborhoods tend to travel to work by MBTA, and further neighborhoods use cars or other vehicles. The primary means of getting to work in Back Bay/Beacon Hill is walking. The MBTA is most important in Charlestown, and the car in East Boston and Allston/Brighton.

## Income Characteristics

### Assessment of Data

Household Survey responses place the median income of Boston's families and unrelated individuals at \$10,700. While the Survey questions were carefully designed to elicit accurate income responses, the expected sensitivity of respondents to inquiries about income appeared in probable understatements of income level.

The level of understatement is seen in the accompanying Table 22 which shows the income distribution of respondents to the March 1979, U.S. Bureau of the Census' Current Population Survey in Boston and its metropolitan area. The median reported income for Boston City residents for the previous year (1978) is computed to be \$13,177, some 27 percent higher than that reported in the Boston Redevelopment Authority Household Survey for 1979. Discrepancies of this size due solely to chance seem unlikely. Therefore, some caution should be exercised in comparing Household Survey income data with income data from other sources.

For instance, the Current Population Survey data show that Boston's median income is within five percent of the national median of \$13,815 for families and unrelated individuals in 1978. Comparisons of Household Survey data with national figures would present an inaccurate description of the differences. Nevertheless, the Household Survey data provide important information for comparing incomes of different areas within Boston. Therefore, it is the aspect of these data that is emphasized most heavily.

## Income by Neighborhood

The median income of families and unrelated individuals reported for the City of Boston in the Household Survey was \$10,700 for 1979. Within the City, Back Bay/ Beacon Hill, West Roxbury, and Charlestown had the highest median incomes, ranging from \$16,100 to \$14,000. The lowest median incomes were reported for South Boston (\$7,300), Roxbury, (\$7,500), and East Boston (\$7,800). The median for Allston/Brighton was somewhat less than that for the City at \$9,700.

The distributions of family unit incomes by neighborhood in Table 23 differ significantly. East Boston has a very heavy concentration of families and unrelated individuals who report incomes lower than \$7,000. Charlestown has a smaller concentration of this income group, and another concentration in the middle-income group. Back Bay/Beacon Hill has a whale-shaped distribution, a single broad hump with an upturned tail at the upper end of the income distribution. Allston/Brighton incomes appear to have a single, normal hump.

The median income for families in Boston is somewhat higher, \$13,200 reported for 1979. The differences among neighborhoods seen in Table 24 are larger than those for family units. (Please see Appendix A for definition of family and of family unit). Back Bay/Beacon Hill families earn an average of \$40,000, compared to \$12,300 in Allston/Brighton, \$16,950 for Charlestown, and \$11,000 for East Boston. The differential between Back Bay and the rest of the City is astounding. It is due to factors seen already: very small families precluding children by and large, an extremely high employment rate, both of which indicate a high proportion of two-worker families, and a very high percentage of these workers employed in professional, technical, and managerial positions.

A comparison of family income in 1969 in constant dollars must be cautiously interpreted. While it generally shows a shift of families to the lower end of the family income distribution, this perceived trend must be weighed against the knowledge of income underreporting. For the City as a whole, the two tendencies virtually cancel out each other leaving Boston with essentially stable income. It is more difficult to assess the effect for individual neigh-

borhoods. The best rule-of-thumb might be to assume that the neighborhood's ranking in terms of income relative to the City also represents its rankings in the gains made in real income during the last decade.

When family income is partitioned by neighborhoods and family unit size, the observed differentials appear again. Grouping lower income Fenway/Kenmore with its many single-persons households and upscale Central/Back Bay/Beacon Hill left this grouping below the median for single persons. However, among two or more persons family units this group of neighborhoods had the highest median income by far. Its \$33,300 median was close to two-and-a-half times the citywide multi-person median of \$13,200. East Boston/South Boston/Charlestown remained below the citywide medians for single- and multi-person families. Allston/Brighton was close to the median for both types of family units.

The differential income of neighborhoods can be better understood when the source of that income is known. For instance, only 55 percent of East Boston family units cite wages and salaries to be their largest source of income. This means that over 40 percent of East Boston family units are dependent on transfer payments such as Social Security, unemployment, welfare, and veterans' benefits. For Charlestown, the ratios shift to two-thirds of families and unrelated individuals relying primarily on wages, and one-quarter dependent on transfer payments. In Allston/Brighton and Back Bay/Beacon Hill, the number of family units citing wages as their primary source of income rises to 80 percent and almost 90 percent, respectively. Those dependent on transfer payments dwindle to 12 percent and to only 1 percent, again respectively. The source of income data in Table 27 definitely relate to observed income differentials, and may also relate to attitudes and lifestyle.

Table 28 indicates more than 20 percent of Boston's family units thought they could get by on less income. The proportion of family units was over 50 percent in Charlestown, almost 40 percent in Back Bay/Beacon Hill, about 25 percent in Allston/Brighton, and some 15 percent in Charlestown, where income was initially much lower.

## Low Income Status

Just over 22 percent of the families and unrelated individuals living in Boston in the Spring of 1980 reported incomes below the low-income standard. As might be expected, East Boston and Charlestown had disproportionate shares of low-income family units (34 percent and 29 percent, respectively). Allston/Brighton, with 16 percent, and Back Bay/Beacon Hill, with 5 percent low-income units, were considerably under the Boston average shown in Table 29.

Just over one-quarter of Boston's families are classified as low-income on the basis of their reported income (See Table 30). The proportions for the focal neighborhoods do not change significantly from those in Table 29, with the exception of Allston/Brighton where one in four families qualifies as low-income, compared to one in seven family units. This indicates that the families in Allston/Brighton are less well off than are the unrelated individuals living there. However, the statistics for Allston/Brighton should be viewed with caution because there were a disproportionate number of subsidized housing units drawn into the sample for that neighborhood.

## Housing

### Vacancy Rates

In Spring 1980, 5 percent of Boston's housing units were vacant (Table 31). Allston/Brighton had only a 2 percent vacancy rate. Back Bay/Beacon Hill experienced the citywide average, 5 percent. East Boston and Charlestown had 9 percent and 18 percent, respectively. The very high rates in Charlestown are the result of vacant and largely uninhabitable public housing units.

Thirty percent of Boston's housing units are owned, a slight increase from 1970's 27 percent (Table 32). East Boston and Charlestown share Boston's average. Back Bay/Beacon Hill and Allston/Brighton are closer to half this average. Back Bay/Beacon Hill's ownership of units has grown from 6 to 19 percent since 1970 due to condominium conversion. Allston/Brighton's proportion of units owned has dropped from 19 percent to 14 percent, which probably reflects the oversampling of public housing units mentioned above.

## Characteristics of Housing Units

The average number of rooms per housing unit is 4.5 for Boston, East Boston, and Allston/Brighton. Charlestown is slightly higher at 5.0 rooms per unit; Back Bay/Beacon Hill is considerably lower with 3.0 rooms per unit.

Back Bay/Beacon Hill is also distinctly different from the other three neighborhoods with respect to modern conveniences in its housing units (Table 34). On average, about half of its units have air conditioning, a dishwasher, and/or a disposal compared to one-quarter or less of the units in Charlestown, East Boston, and Allston/Brighton.

Yet, Back Bay/Beacon Hill is very similar in how secure its residents feel their homes/apartments are (Table 35). Eighty-four percent of East Boston, Charlestown, and Back Bay/Beacon Hill dwellers feel their home is secure when they are there, compared to 80 percent for all Boston. The proportion drops to 70 percent for Allston/Brighton. Also, fewer Allston/Brighton residents feel their dwellings are safe in their absence, some 60 percent, as opposed to two-thirds for Back Bay/Beacon Hill and three-fourths of East Boston and Charlestown households.

## Rental Payment

The median monthly rental payment for the City was \$190 (Table 36). Allston/Brighton's median was identical, while that for East Boston/Charlestown was lower (\$160) and the Central/Back Bay/Beacon Hill median was higher (\$270). While there has been little change in the average real, monthly contract rents for East Boston and Charlestown (Table 37), there has been a small increase for Allston/Brighton (4 percent) and a larger one for Back Bay/Beacon Hill (11 percent). However, these changes, measured in constant dollars, are smaller than the Bostonwide increase of 12 percent in monthly rents.

Interestingly, this rental payment is just over 25 percent of reported income for all four neighborhoods, as computed from information in Table 38. However, the actual distribution of proportion of family income paid in rent is more complex. Each neighborhood grouping shows three humps at 15-19 percent,

30-40 percent and 50 percent or more of income, although the exact shapes of the distributions differ. Therefore, throughout each of these neighborhoods, some family units spend a large proportion and others a small proportion of their income on rental housing. A similar pattern was seen in 1970 U.S. Census data also.

### Heating Costs

The cost of heat is included in the rent for about half the rental homes/apartments in East Boston and Charlestown, but about 80 percent of those in Allston/Brighton and 90 percent of those in Back Bay/Beacon Hill. This may partially explain the differential in median rental payment.

Table 40 shows that over half of East Boston's and Charlestown's units were heated by gas. About one-third were heated by oil. In contrast, three out of four dwellings in Back Bay/Beacon Hill and Allston/Brighton were heated by oil. About 20 percent of the households used a secondary heating source, regardless of neighborhood or type of primary heating fuel. Among those paying for heat separately, payment was a burden for 10 percent of those in Back Bay/Beacon Hill (Table 41), about 20 percent of those in Charlestown, and 40 percent of East Boston and Allston/Brighton residents.

### Heat Conservation

Boston residents used several heat conservation measures in addition to use of a second source of heat mentioned above. Table 42 shows that a third have insulated their housing units. Small proportions have modified heating systems or made home repairs. These improvements are completed twice as frequently on owned units as on rented units.

Still, there is a need for more heat conserving measures. About 40 percent of Charlestown, Back Bay/Beacon Hill, and Allston/Brighton households reported their windows were not sealed (Table 43). Less than a quarter of East Boston residences had leaky windows. Again, the proportion varies with homeownership. About a quarter of East Boston residences lacked storm windows (Table 44). The proportion rose to 40 percent for Charlestown,

45 percent for Allston/Brighton, and 68 percent for Back Bay/Beacon Hill/Kenmore. About one-quarter of the housing units in each of the four neighborhoods was not or was poorly insulated (Table 45).

Even with the obvious need to institute heat conserving measures, over 80 percent of Boston residents (Table 46) planned no changes to dwelling units to conserve heat. Undoubtedly, this is related to homeownership patterns, income, and how affordable extra heating costs were. Insulation was the most frequently mentioned change planned.

### Mobility

Boston is a city characterized by the stability of some portions of its population and the high mobility of other portions. Close to 40 percent of Boston's residents have lived here less than 5 years; the same proportion have lived here more than 20 years (Table 47), with the average length of residence in Boston being 22 years. Whites tend to be mostly new arrivals (less than 5 years) or oldtimers (more than 30 years of residence). Blacks' length of residence tends to be middle- to long-term, more than five years, confirming the idea of little black immigration in the past decade. Hispanics tend to be recent arrivals or mid-length residents.

Three distinct patterns of length of residence, in dwelling unit not in City of Boston are seen in four Boston neighborhoods in the Eighth District. East Boston and Charlestown have fairly long average lengths of residence, 10-11 years. However, while both have heavy concentrations of long-term residents, Charlestown continues to have a strong influx of new residents, while East Boston's new residents have tapered off in the last few years, as seen in Table 48. Back Bay/Beacon Hill and Allston/Brighton's white family units on the other hand, have a short average length of residence, 3.5 and 4.9 years, respectively. Over 50 percent of the white families and unrelated individuals have lived in their homes less than two years, and almost 90 percent for less than ten years. These are very mobile populations subject to a great deal of turnover, even though a good deal of the movement may be between dwellings in the same neighborhood.

Table 49 indicates how much of this mobility may be within neighborhoods and how much is due to movement in and out of neighborhoods. About 40 percent of Back Bay/Beacon Hill residents used to live elsewhere in that neighborhood; the figure is 24 percent for Allston/Brighton. Back Bay/Beacon Hill's strongest appeal is to persons from outside the Boston area (29 percent of its current population), many from other large cities. It has drawn 14 percent of its population from the adjoining neighborhoods and again from Boston suburbs. Allston/Brighton tends to draw most heavily from the Boston suburbs (28%), outside the Boston area (22%) and the rest of Boston (18%). Students and other young adults are a major component in the migration into these neighborhoods.

Charlestown and East Boston show distinctly different migration patterns. Two-thirds of East Boston residents moved within the neighborhood. Relatively small proportions came from other areas. Over half of Charlestown's family units moved within the neighborhood, another 24 percent came from elsewhere in Boston, and some 21 percent from outside the City.

### Conclusion

The Boston neighborhoods in the Eighth District are enormously diverse. East Boston, Charlestown, Back Bay/Beacon Hill and Allston/Brighton differ in more ways than they resemble each other. Age distribution, ethnic background, household composition, income characteristics, occupations and mobility patterns are facets that reflect a different mix of people in each of these areas. It provides a challenging and diverse constituency.

Based on 1,438 cases (weighted).

1. Location of previous residence is recorded as the neighborhood reported by the respondent. Therefore, reported locations of previous residence may not correspond exactly to the B.R.A. planning district boundaries used to define the neighborhood of current residence.
2. These neighborhoods have substantially different boundaries for current and previous residential neighborhoods. Therefore, the "same neighborhood" and "adjoining neighborhood" categories frequencies are for non-corresponding areas and vary accordingly.

## APPENDIX A

### DEFINITIONS AND EXPLANATIONS OF TERMS USED IN THE HOUSEHOLD SURVEY

Definitions of population and household characteristics are adapted from or are the same as those used by the U.S. Bureau of the Census. All characteristics of individual persons and housing units are given by respondents. The only exceptions to this are for the types of appliances in the kitchen, how modern the kitchen is, the number of units in the building, and exterior condition of the housing. These characteristics are reported by the individual conducting the interview.

#### GEOGRAPHY

Neighborhood - The term neighborhood refers to one of sixteen BRA Planning Districts in Boston.

Boston Metropolitan Area - The Boston metropolitan or "metro" area consists of towns and cities surrounding Boston which are socially and economically integrated with Boston. The metro area, as used in the survey, includes the Boston Standard Metropolitan Statistical Area as it was defined in 1970.

#### CHARACTERISTICS OF PERSONS

Non-White - This category includes persons who designated themselves to be Black; Oriental, including Chinese, Japanese, etc.; American Indian; Cape Verdean; of mixed racial background or other non-white. This category is generally comparable with the 1970 Census term, "Negro and other races."

Minority - Individuals were classified minority if they designated themselves to be Black, Oriental, American Indian; Cape Verdean, of mixed racial background, or other non-white (all of which are included in non-white) or Hispanic, which includes Puerto Rican, Cuban, South American, etc., in response to the question on the person's background. This definition is not comparable with that used in the 1970 Census, which included category "Persons of Spanish Language," which derived from separate questions on mother tongue.

Race - The categories of race include those listed under "Minority" plus the category White, meaning White not Spanish.

Ethnicity - Ethnicity is determined by the country of origin of a person's family. The question asks, "From what country or part of the world did most of (PERSON'S) family come from originally?" A Black person might answer, Africa or Jamaica. A person whose parents came from different countries, for example, Ireland and Poland, would answer whichever country (most of his or her family came from, or whichever) seemed most appropriate. The information obtained from this question is not comparable to 1970 Census information, though it will be fairly compatible with 1980 Census information.

Handicapped - A person is defined as handicapped if he or she has a physical, emotional, or other health problem that limits the amount or kind of work he or she can do at a job or in school. Respondents could select from among a great variety of illnesses and disabilities, some of which are temporary -- such as pregnancy or hepatitis.

#### HOUSEHOLD, FAMILY AND UNRELATED INDIVIDUAL

Household - A household includes all the persons who occupy a group of rooms or a single room which constitutes a housing unit. These residents may be related to each other (a family) or be unrelated individuals who share the unit.

Family Unit - A family unit consists of two or more persons related by blood, marriage or adoption. A single individual living alone or with unrelated persons is also considered a family unit.

Family - A family is a family unit which contains two or more family members.

Unrelated Individual - An unrelated individual is a member of a household who is not related to any other household member by blood or marriage, e.g., a person living alone, sharing a house or apartment with other unrelated individuals, or a boarder in a home.

Head of Family Unit - The head of a family unit is defined by policy as (1) the only adult, (2) husband of a married couple, (3) the person whose age is closest to 45 years.

#### EMPLOYMENT STATUS

Employed - A person is considered employed if he/she is 16 years and over and was working in the week prior to the interview date or on paid leave, or was working without pay in a family business, working at least fifteen hours a week, or was on temporary lay-off from a job due to lack of work.

Unemployed - A person 16 years and over who is not employed for pay but has been seriously looking for work during the previous four weeks and is available to accept a job. Examples of job search activities are interviewing or calling/ visiting potential employers or applying for potential jobs or collecting employment information. In addition, persons who have jobs which have not yet started are considered unemployed.

Labor Force - The labor force includes all persons 16 years of age and over who are either employed (including members of the Armed Forces) or unemployed.

Not in the Labor Force - All persons 16 years and over who are not classified as employed or unemployed are defined as not in the labor force. This category consists of retired workers, homemakers, students and ill or disabled persons.

Labor Force Participation Rates - Labor force participation rates are determined by summing all labor force participants in a particular population, and dividing by the total number of persons in that population 16 years and over.

Industry - The industry in which a person works is the kind of organization or business in which he is employed -- for example, a hospital, construction firm, or a government agency. The Standard Industrial Code (SIC) is used to categorize employing organizations.

Occupation - An occupation is the kind of work a person does, for example, clerical work, welding, or sales. The 1970 Census occupational code is used as the basis for classifying types of jobs.

## ECONOMIC CHARACTERISTICS

Family Income - Family income is the total of the income from all sources that flows to all family members.

Unrelated Individual Income - The income of a single person.

Household Income - The combined income of all single people and families occupying a housing unit.

Source of Income - One of numerous specified categories contributing at least \$500 per year to family income. The categories are wages and salaries; income from property; transfer payments; alimony; child support; gifts; pension or annuity; scholarship or fellowship; inheritance or life insurance; and gambling or lottery.

Low Income Status - A family or single person (unrelated individual) is defined as being low-income if total family or individual income is below 70% of the Bureau of Labor Statistics lower living standard for the person or family, adjusted by family size. The guidelines apply to the Boston Metropolitan Area and are not the same as poverty guidelines. Because family units and individuals were not asked to report their exact income in the survey, but rather to select an income category in which their 1979 income fell, it is impossible to be precise in assigning families and persons to low-income status. Below is a table presenting family unit size, low-income threshold, and the income cut-off used in the survey.

<u>Family Size</u>	<u>Low Income Guideline</u>	<u>Survey Income Category</u>
1 Person	\$ 3,790	\$ 3,999 or less
2 Persons	5,160	4,999 or less
3 Persons	7,090	6,999 or less
4 Persons	8,750	8,999 or less
5 Persons	10,330	9,999 or less
6 Persons	12,080	
7 Persons	13,830	14,999 or less
8 Persons	15,580	
9 Persons	17,330	19,999 or less
10 Persons	19,080	

## HOUSING CHARACTERISTICS

Housing Unit - A housing unit is a home or apartment.

Number of Rooms in Housing Unit - The total number of rooms in a housing unit excludes bathrooms, porches, halls, and unfinished rooms in the basement or attic.

Rental Payment - Rental payment is the monthly dollar amount spent by a family unit for apartment rent, including heat.

Contract Rent - Contract rent is the monthly rent agreed to or contracted for, regardless of any furnishings, utilities or services that may be included.

## APPENDIX B

### METHODOLOGY, SAMPLING PROCEDURE AND STATISTICAL ERROR OF THE BOSTON HOUSEHOLD SURVEY

The Boston Household Survey was conducted by the Center for Survey Research of the University of Massachusetts for the Boston Redevelopment Authority during the late winter and spring of 1980. Its purpose was to provide up-to-date, specific and accurate information about persons living in households in the City of Boston and its neighborhoods. Planners and program administrators within city government, executives and decision makers in both the public and private sectors, and researchers have all needed updated information. The main source of information on the characteristics of Boston households has been the decennial U.S. censuses. Yet, the 1980 U.S. Census results will not be available until at least 1982. Therefore, the survey results will provide much needed information in the interim as well as additional information not available from the U.S. Census.

The advantage of a sample survey is that timely information can be gathered quickly and relatively inexpensively. However, because the information is received from a sample of Boston's population rather than the entire population, the results are subject to statistical error. Statistical error is a measure of the degree of uncertainty or, obversely, the level of confidence that should be associated with the survey results. Throughout this report error will mean statistical error, as opposed to mistakes.

This report provides a brief description of the survey methodology. It indicates how the sample was chosen, some of the measures used to insure a high response rate, and the resulting sample sizes. It also indicates some of the limitations of this survey, and surveys in general.

The Boston Household Survey was designed and conducted so as to obtain information that is representative, relevant, accurate, and reliable as

well as timely. The questionnaire was carefully worded and standardized to insure that each interviewer asked exactly the same questions of each respondent.

The households interviewed were chosen by a stratified two-stage cluster sampling process.<sup>1</sup> In the first stage, the nearly quarter of a million housing units (and all the land area) in the City of Boston were assigned to one of nearly 3,500 "sampling units" of approximately 60 households each. These "sampling units" were chosen randomly at a rate of 1/15 in most neighborhoods. In a few neighborhoods where this would have yielded too few interviews, the sampling fraction was increased. In Charlestown, 4 out of every 15 sampling units was chosen; in Central, South End, Roslindale and West Roxbury the sampling fraction was 2/15. Within these sampling units, every tenth housing unit was chosen to be interviewed. This systematic selection of every tenth household helped to distribute the sample throughout the cluster, i.e., sampling unit, thereby offsetting the increased sampling error resulting from clustering.

The intended overall sampling rate of households for the City of 1/150<sup>2</sup> became 1/125 with the addition of housing units in the five neighborhoods. The sample numbers for each of the five neighborhoods were subsequently weighted, i.e., divided by the number of times they were oversampled (2 or 4) to yield citywide averages that reflect the actual proportion of City households in that neighborhood.

---

1. More detailed information about the sampling process can be obtained from the BRA Research Department.

2. Overall sampling rate for households is the probability of the sampling unit being chosen times the probability of the households within the sampling unit being picked.

The initial selection process produced a list of some 1,900 housing units whose occupants were to be interviewed. No substitutions for any of the selected households were allowed. Of the 1,967 households screened, 266 were vacant or for other reasons not included in the eligible sample (of 1,701 occupied units). In these 1,701 occupied housing units were 1,701 families or individual persons and an additional 165 unrelated persons who may have been roommates, lodgers, boarders, etc. Both the head of family unit (family or single person) and any unrelated persons were interviewed. Of the 1,857 potential interviews, 1,449 were completed, 1,314 were household heads and 135 with unrelated persons. This yielded a 78% response rate citywide.

Every effort was made to obtain an in-house interview from households chosen for the sample including an advance letter, six personal on-site calls by an interviewer at different times of day, and telephone interview attempts thereafter. The household response rate for neighborhoods varied between 72% and 82%. The sample size goal to yield reliable neighborhood results was 70 completed interviews in each neighborhood. Four neighborhoods had fewer than seventy interviews<sup>3</sup>; there are probably too few household interviews in North Dorchester to produce reliable results. See Table 1.

In addition to the numbers of and response rates for sampled family units, Table 1 gives the numbers of persons or person sample base by neighborhoods. Information was obtained for 2,656 persons throughout Boston. The numbers for the oversampled neighborhoods have been deflated by factors of 4 or 2 to reflect their actual proportion of Boston's population.

---

3. There were 51 completed interviews in Fenway, 58 in Hyde Park, 61 in Mattapan and 43 in North Dorchester.

Table B1 SAMPLE NUMBERS OF ELIGIBLE UNITS AND COMPLETED INTERVIEWS WITH RESPONSE RATES BY NEIGHBORHOOD (BRA Planning District)

<u>Planning District</u>	<u>Occupied Housing Units Plus Unrelated Individuals</u>	<u>Completed Interviews</u>	<u>Response Rate</u>	<u>Persons Reported In Interviews*</u>
East Boston	93	72	77%	185
Charlestown	99	79	80	47 (188)
South Boston	97	77	79	183
Central	114	84	74	63 (126)
Back Bay/Beacon Hill	130	101	78	124
South End	115	91	79	91 (182)
Fenway/Kenmore	71	51	72	68
Allston/Brighton	222	186	84	323
Jamaica Plain/Parker Hill	107	77	72	169
Roxbury	146	105	72	258
North Dorchester	56	43	77	153
South Dorchester	139	112	81	303
Mattapan	85	61	72	203
Roslindale	153	126	82	167 (334)
West Roxbury	155	126	81	164 (328)
Hyde Park	74	58	78	156

\* Numbers of persons in this column have been weighted. Numbers in parentheses are unweighted numbers of persons, the actual number of persons reported.

Source: Floyd J. Fowler, Jr., "Final Report: Procedures for Survey of Boston's Neighborhoods", Center for Survey Research, University of Massachusetts-Boston, June 1980; Survey results.

While this survey was carried out in a careful scientific manner, the user should be aware that there is error inherent in any sample survey results. Therefore, some cautions are necessary in the use and interpretation of these data.

The user must recognize that this is a sample of Boston's housing units and their associated households. As such, it fails to include persons in dormitories, jails, convents, nursing homes, and other "group quarters" as well as those with no permanent home. Although the impact of this bias may be small, it is well to bear in mind that this is not a sample of the City's entire population, both for the representativeness of the results and their comparability with other data sources, such as the U.S. Census.

The largest source of error is nonresponse, cited above. Fortunately what information is available about nonrespondents indicates that they do not differ systematically and significantly from respondents except that they are more likely to live alone or with one other person. However, we cannot really know in what way the absence of 22% of Boston's family units from our sample biases our results.

Another source of error is sampling error or variability which is due solely to chance. It is the error associated with taking a sample rather than the entire population as the study group. It is akin to the notion of the variability in the number of heads and tails turned up during 100 tosses of a coin. The amount of error associated with a sample percentage depends on both the size of the reported percent and the sample size on which the percent is based. Table 2 indicates the appropriate error for each sample value. The error, in general, declines as the sample values are further from 50% and the sample size increases. The user should not assume that the sample value

is exactly the value for the population. The correct interpretation of sample results and the associated error is that the true value for the population lies somewhere within the range of sampling error around the sample value.

For instance, the sample survey results indicate that the percentage of persons who have never married is 47% for persons 25-34 years old and 22% for those aged 35-44 years. Because these percentages are based on a sample, it is uncertain whether or not the actual values for Boston are 47% and 22%. However, we can be almost certain that the true values lie close to these percentages. The calculation of sampling errors in Table 2 helps us to know how close. The 47% figure comes from the fraction 249/532. Therefore, when we look at Table 2 we look for the row in which sample size is about 500 and the column in which reported percent is about 50%. This yields a sample error of 5%. From this information, we know that the actual percentage unmarried of 25-34 year olds lies between 42% and 52% ( $47\% \pm 5\%$ ). Similarly, for those aged 35-44, the proportion unmarried is 54/249 or 22%. This time the associated sampling error is found at the junction of sample size 250 row and reported percentage about 20% column. The sampling error is 6%, so the population value is expected to lie no more than 6% from the sample value 22%, or between 16% and 28%.

This statement about error is not intended to discourage use of survey information. Instead, use of these materials is encouraged; the data included are the most current available and, in some cases, are not obtainable from any other reliable source.

Table B2    SAMPLING ERRORS BY SAMPLE  
SIZE AND APPROXIMATE REPORTED PERCENTAGE

<u>Sample Size</u>	<u>5 or 95%</u>	<u>10 or 90%</u>	<u>20 or 80%</u>	<u>50%</u>
50	-	-	12	16
75	-	7	10	13
100	-	7	9	11
150	4	5	7	8
175	4	5	7	8
200	3	5	6	8
250	3	4	6	7
300	3	4	5	6
400	2	3	4	6
500	2	3	4	5
750	2	3	4	5

Chances are 95 in 100 that the true value lies within the reported survey value plus or minus the number of percentage points shown in this table. Errors included here assume average net design effect for clustering and stratification is 1.2.
